

## The CMS Needs You!

The Crisis Management System is out there to protect and inform the people in case of the inevitable monstrous attack on your city.

Built with TYPO3 the CMS is administered by motivated teams on premise, setting up the website as an effective early warning system and control centre for counter measures.

To achieve this the Crisis Management System employs teams of three divisions working closely together.

**Do you want to know more?**

## Editor

The editors for the CMS make sure that the content of the website is up to date and informs on current threats.

Editors need to create and curate news, provide relevant media assets, and make sure all necessary translations are available.

**As an editor you get the info out there.**

## Integrators

Integrators provide the necessary infrastructure of CMS website, creating the underlying template for the presentation and installing and configuring all the more or less useful extensions required by the other staff.

**As an integrator you keep the system running.**

## Developer

Dealing with monstrous attacks has its special requirements, far beyond ready-to-use extensions.

Developers understand the architecture of the website and know how to implement new features by best practice.

**As a developer you deal with the serious threats.**

# Be always ready!

Each Crisis Team keeps watch over a city district, reacting on incoming alerts and adapting the CMS according to the current situation. The better each team performs during drills (or an actual threat) the more citizens can be reached and lead to safety.

As a distributed system CMS allows externals to support the teams on location – be it with providing additional intel, useful gear or other resources.
